

# Paint Repairs

This bowl was left out for the winter, full of water. This is an extreme example, but we were able to easily fix it and get the fountain back in operation!

**You will need the following:**

- ① Mid-grade Sandpaper
- ② Spray Paint
- ③ Clear Sealer Spray (optional)

Many paint and craft stores sell a variety of colors that may provide a close match to your unit. Any brand will suffice, and if painting the entire inside of the bowl as pictured below, the exactness of the color match is not critical. The objective is to get it back in action!

Clean affected bowl

Cut small piece of sandpaper

Thoroughly sand the bowl.

Sand until smooth, removing all loose paint

Wipe bowl clean of debris. Find suitable match in colour.

Apply a light coat over the interior of the bowl.

Apply two more coatings, allowing sufficient time to dry between coats

A final coat of paint sealer or waterproofing should be applied to protect the repaired product.

While each scenario may vary, these general steps can be followed to achieve a "like new" finish for most paint repairs.

**We recommend allowing the piece ample time to dry before resuming use.**
