

Tech-Tip: Proper Installation of LED Lights

For proper assembly and operation of your fountain, creating a 'drip-loop' with the cords from the light and pump is a necessary step for operation without water-loss.

The picture to the left illustrates an **improper assembly** and is an example of what NOT to do.

The cords from the lights above exit the fountain immediately. As a result, any water that naturally drips inside the fountain follows the cords creating what may seem like a leak.

The circled areas illustrates where water has followed the cord out the back of the fountain.

The picture to the left shows the **proper way** to assemble the fountain.

The cords from the light are routed down deep inside the reservoir, creating the 'drip-loop' that protects against water loss. Any water that may follow the cords will now return to the reservoir as intended.

The cords then exit the fountain and are draped over the edge as shown.

Reminder: the connector and transformer should not be submerged inside the fountain.
